Cloning of murine TCF-1, a T cell-specific transcription factor
interacting with functional motifs in the CD3-epsilon and T cell
Teceptor alpha enhancers
J. Exp. Med. 173 (5), 1133-1142 (1991)

* NOTE: This is a 'working draft' sequence. It currently consists of 23 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                    The present invention describes a library of human polynucleotides

comprising the sequences given in AA212532 to AA21779 Also described is

comprising the sequences given in AA212532 to AA21779 Also described is

a method of detecting differentially expressed genes correlated with the

cancerous state of a mammalian cell, comprising detecting at least one

differentially expressed gene product in a test sample from a cell

collaboration of being ancerous, where the gene product is encoded by one

of the 5248 polynucleotide sequences given in AA212532 to AA217799. The

collaboration of polymorphisms believed to detection of expression levels,

mapping, tissue typing or profiling, forensics, genetic analysis and

detection of polymorphisms. Polypeptides encoded by the polynucleotides

can be used for ataing antibodies for experimental, diagnostic and

therapeutic purposes. The polynucleotides may also be used to construct

cherapeutic purposes. The polynucleotides may also be used to construct

arrays for diagnostics (which may be used to determine function of an

two cells (e.g. to identify abnormal or diseased tissue in a human, to

concells (e.g. to identify abnormal or diseased tissue in a human, to

diagnosis, prognosis and management of colorectal cancer, breast cancer,

AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; uninearly; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; cardiant; thrombolytic; coagulant; vasoiropic; antidabetic; hypotensive; dermaclogical; immunosuppressant; cardiant; thrombolytic; coagulant; vasoiropic; antidiabetic; hypotensive; dermaclogical; immunosuppressive; antidiabetic; hypotensive; dermaclogical; immunosuppressive; antidiabetic; hypotensive; dermaclogical; immunosuppressive; antidiabetic; hypotensive; or presence of or predisposition to, or preventing or Lreating cantidity and actions associated with an ORFX-associated disorder. The nucleic acids can be used for express ORFX proteins in gene therapy cactors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, by pretension, hypothyroidism, cholesterol ester storage, systemic lupus capternal or fungal infection, malaria, autoimmune disorders, asthma, barmaglobinuria, antiniflammatory disease, to cnhance contains, printiniflammatory disease, conhance conhance conhance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Hundinquon's disease; handsostatic; amyotropic lateral sclescosis; Shy-Drager Syndrome; chemotactic; chemotactic; thrombolytic; drug screening; arthritis; inflammation;

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymorleotides are useful of the invention may be used to treat diseases of the pripheral nervous containing a polypeptide or polymorleotide or system, such as peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as Immune system suppression, continisation of the activities such as Immune system suppression.

Cantininibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, ancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and contains and inflammation, leukaemias and contains and activity, arthritis and inflammation, leukaemias and contains an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence data for this patent did not form part of the printed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM36642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities auch as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and CNNS disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Note: The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a cDNA clone related to the DNA encoding the Fc receptor-like IV protein (FcR-IV) of the invention. Cells containing the BNA are used to express the recombinant protein, and to screen for specific (ant)agonists. The proteins are used to induce phagocytosis, and their (ant)agonists are used to treat immune complex related diseases (e.g. rheumatoid arthritis, systemic lupus erythematosus, heamolytic cancer, lymphoma, leukaemia, infection by intracellular pathogens etc). The antagonists are also useful as immunomodulators and inhibitors of viral (e.g. human immune deficiency or denque viruses) entry into cells. The proteins may also be used to screen for specific binding agents, i.e. (ant)agonists, for raising antibodies (Ab), and for identification of particular cells or tissues. The Ab can be used therapeutically as antagonists, as assay reagents for diagnostic determination of the levels of expression of the proteins and for affinity purification of the proteins. The DNA and its fragments are useful as hybridisation probes or primers for isolating related genes, in situ hybridisation (chromosome mapping) and diagnostically to measure mRNA expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

an Acci-bgli subfragment from the core of the rat 3'enhancer
an Acci-bgli subfragment from the core of the rat 3'enhancer
(nucleotides 437-748). Two overlapping gps. of clones (lambda M2 and
lambda M3) were isolated. Phage lambda M3 extends 3' of lambda M2.
The sequence of the mouse IgH 3' enhancer was determined and aligned
with that of the rat. Hybridisations of subclones of the mouse IgH
3' enhancer to phage lambda M2 showed that the 3' enhancers of mouse
and rat were present in the genome in opposite orientations. The
specific expression of genes, so may be used to target tissue
specific expression of proteins and in hybridoma technology. The
enhancer may be used to enhance expression of genes in host cells, in
transgenic animals. It may be used in the prodn. of monoclonal
cransgenic animals. See also AAQ31726.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ataxia telangiectasia; ATM protein; assay; interaction; kinase activity;

A cDNA clone (AAT61981) codes for human ataxia and rad related checkpoint protein (ATR) (AAW13152), which controls progression through the cell cycle. Probes based on the yeast homologue rad3 sequence (see also AAT61982) were used to amplify a fragment from human leucocyte cDNA, which was used to screen a macrophage library. The sequence was completed by RACE PCR. The gene has been localised to chromosome 3422-25. It may be involved in hereditary diseases such as cancer, chromosome breakage, unstable phenotype and repair damage sensitive phenotype. The ATR gene can be used in produce antisense molecules or dominant negative mutants. It can also be used to produce ATR protein and as a probe to detect ATR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sudduth-Klinger J;

                                                                                                                                                                                                                                                                                                                                                                                        The present sequence encodes a human ATR (FRP1) protein. The protein is used in the course of the invention. The specification describes an assay method for a compound able to modulate the interaction between ATM or a protein having an associated kinase activity and p53 or a protein having homologous phosphorylation sites. The assay comprises contacting a peptide fragment ATM with a relevant fragment of p53 and a test compound, and determining the interaction or binding between the substances and the test compound. The assay method is useful for screening for compounds able to modulate the interaction between ATM and p53. The screened agents, peptide fragments and mucleic acids are useful for therapy involving modulating ATM action e.g. in the treatment of cancer, immunosuppression or HIV infections by modulating phosphorylation of p53 by ATM, and for purifying the proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                        Assay method for compounds modulating the interaction of ATM and p53 - useful for the treatment of e.g. cancer, immunosuppression and HIV infections and for the purification of the proteins ATM and ATR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        target ligands comprises, contacting a candidate mixture with the target ligand so that nucleic acids with an increased affinity for the target can be partitioned from the remainder of the candidate mixture; partitioning the increased affinity nucleic acids from the remainder of the candidate mixture and amplifying them. Preferably this procedure is repeated numerous times to yield a desired level of ligand enrichment. A template DNA (AAO$2240) was used to synthesise candidate ligands (see AAO$22405 AAU$3557-053577) which are specific for HIV reverse transcriptase. This sequence
                                                                                        Stem 2(b) as does Stem 2(a) to 2(b)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A method (SELEX) for identifying nucleic acid ligands which bind
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying nucleic acids which bind target ligands \cdot by partitioning increased affinity nucleic acids from candidate mixt. and amplifying these nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            54.3%; Score 19; DB 14; Length 41 62.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                           invention also describes a method of detecting differentially expressed invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test cample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting differentially expressed genes correlated with a cancerous state of a mammalian cell. The polynucleotides can also be used as probes for centecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of cancer, or metastatic cancerous states, stages of cancer, or responsiveness of cancer to therapy). This is particularly for breast cancer, oestrogen receptormer, and colon cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   QQ
   AATO7716-T07740 represent HIV-1 reverse transcriptase (HIV-1 RT) ligands identified by a systematic evolution of ligands by exponential enrichment (SELEX) reaction. This sequence forms a pseudoknot structure carbinent (SELEX) reaction. This sequence for this SELEX reaction is represented by AATO7715. In a SELEX reaction, a target molecule is contacted with a mixture of random nucleic acids under conditions favourable for binding. Unbound nucleic acids are then separated from those bound to the target, and the nucleic acids are amplified to give a dissociated nucleic acids are amplified to give a ligand enriched mixture. These steps are repeated until the specific ligand enriched mixture. These steps are repeated until the specific contacted by acteriophage coat proteins, serine proteases, mammalian receptors, mammalian hormones, mammalian growth factors, ribosomal proteins, DNA polymerases and viral rev proteins. The ligands identified (such as this sequence) may be used in assays, diagnostic procedures, or cell sorting a sman unhibitor of the target molecule function. It may also be used as an inhibitor of the target molecule function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

```
This sequence represents a nucleic acid ligand containing a pseudoknot motif which binds the human immunodeficiency virus type 1 (HTV-1) reverse transcriptase (RT). Ligands to the HTV-1 RT are isolated by the systematic evolution of ligands by exponential enrichment (SELEX) method of the invention. This method is especially used to isolate novel non-naturally occurring nucleic acid ligands having a specific binding affinity for a target molecule, where the target molecule is a protein and the nucleic acid ligand is not a nucleic acid known to bind the rarget molecule. The nucleic acid ligands can be used, e.g. in assay methods, diagnostic proceedures, cell ligands can be used, e.g. in assay methods, diagnostic proceedures, cell sorting, as inhibitors of target molecule function, as probes, as sequestering agents, for therapy or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid ligands for binding proteins - obtained by systematic evolution of ligands by exponential enrichment procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Systematic evolution of ligands by exponential enrichment; SELEX; binding affinity; diagnosis; inhibitor; probe; catalyst; Lemplate; human immunodeficiency virus type 1; reverse transcriptase; ss.
                                                                 Systematic evolution of ligands by exponential enrichment; SELEX; binding affinity; diagnosis; inhibitor; probe; catalyst; template; human immunodeficiency virus type 1; reverse transcriptase; ss.
Pseudoknot motif SELEX ligand 1.8 to HIV-1 reverse transcriptase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           High affinity RNA ligand motif; polymer binding; cell sorting; inhibitor; systematic evolution of ligands by exponential enrichment; SELEX;
                                                                                                                                                                                                      This sequence represents a nucleic acid ligand which binds the human immunodeficiency virus type 1 (HIV-1) reverse transcriptase (RT). Ligands to the HIV-1 RT are isolated by the systematic evolution of ligands by exponential enrichment (SELEX) method of the invention. This method is especially used to isolate novel non-naturally occurring nucleic acid ligands having a specific binding affinity for a target molecule, where the target molecule is a protein and the nucleic acid ligand is not a nucleic acid known to bind the target molecule. The nucleic acid ligands can be used, e.g. in assay methods, diagnostic procedures, cell sorting, as inhibitors of target molecule function, as probes, as sequestering agents, for therapy or as catalysts.
                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                         Nucleic acid ligands for binding proteins - obtained by systematic evolution of ligands by exponential enrichment procedures

```
This sequence represents the pseudoknot portion of the random region of a ligand identified by a systematic evolution of liqands by exponential considered by a systematic evolution of liqands by exponential and independent (SELEX) reaction to isolate ligands specific for bacteriophage considerase. This sequence is part of a ligand of the invention. The ligands are non-naturally occurring nucleic acid the invention. The ligands are non-naturally occurring nucleic acid having the polynucleotide that binds to the ligand by anteson-Crick base pairing or triple helix binding; the ligand by anches a pairing or triple helix binding; the ligand by anches a molecule and the ligand is obtained by: (a) contacting the concern molecule with a candidate mixture of nucleic acids having the arget molecule with a candidate mixture of nucleic acids having the target molecule with a candidate mixture of nucleic acids having the target filinty for the target; and (c) amplifying the separated concerns a filinty for the target; and (c) amplifying the separated nucleic acids. Ligands as above that bind to natural or synthetic nucleic acids. Ligands as above that bind to natural or synthetic receptors, e.g. proteins, may be usoful in assays, diagnostic procedures or call sorting, as inhibitors of target molecule function, as probes, as sequestering agents, etc., or may have catalytic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  High affinity RNA ligand motif; polymer binding; cell sorting; inhibitor; systematic evolution of ligands by exponential enrichment; SELEX; sequestering agent; DNA polymcrase; ss.

Synthetic nucleic acid ligands – that bind to target molecules other
                                                than nucleic acids
```

Example 1; Column 55-56; 137pp; English.

This sequence represents the random region of a ligand identified by a systematic evolution of ligands by exponential enrichment (SELEX) reaction to isolate ligands specific for bacteriophage TV DNA polymerase. This sequence is part of a ligand of the invention.

The ligands are non-naturally occurring nucleic acid ligand with specific binding affinity for a target molecule, where: the target molecule is not a polynucleotide that binds to the ligand by Matson-Crick base pairing or triple helix binding; the ligand by Matson-Crick base pairing or triple helix binding; the ligand by the target molecule, and the ligand is obtained by: (a) contacting the target molecule, and the ligand is obtained by: (a) contacting the target molecule with a candidate mixture of nucleic acids having the target. and (c) amplifying the nucleic acids having the highest affinity for the target; and (c) amplifying the separated nucleic acids. Ligands as above that bind to natural or synthetic nucleic acids. Ligands as above that bind to natural or synthetic polymers, cell surfaces, drugs, metabolites, cofactors, transition-state analogues or toxins, may be useful in assays, diagnostic procedures or connected as a solute and every metabolites, as probes, as a connected as a solute and every metabolites, and another and assays and an analogues or toxins, may be useful in assays, diagnostic procedures or connected and account of the page of target molecule function, as probes, as sequestering agents, etc., or may have catalytic activity.

Sequence 41 BP; 13 A; 9 C; 13 G; 6 U; 0 other;

; Gaps 0; Length 41; 10; Indels Ouery Match 54.3%; Score 19; DB 19; Best Local Similarity 62.9%; Pred. No. 1.1e+02; Matches 22; Conservative 3; Mismatches 10;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 94,

Sequence 2, Application US/09103840A

Patent No. 6294328

GENERAL INFORMATION:
APPLICANT: FIRESCHMAN, Robert D.
APPLICANT: WHITE, Owen R.
APPLICANT: WHITE, Owen R.
TITLE OF INVENTION: DNA SEQUENCES FOR STRAIN ANALYSIS IN MYCOBACTERIUM
TITLE OF INVENTION: TUBERCHICASIS
TITLE OF INVENTION: TUBERCHICASIS
TITLE OF INVENTION: 19867007.00
CURRENT PILING DATE: 1998-06-24

NUMBER OF SEQ ID NOS: 2
SOFTWARE: PatentIn Ver. 2.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CTHER INFORMATION: CDC 1551
